```

The invention relates to a method for modulation of viral maturation. The invention also provides an isolated protein complex comprising a HECT-RCC1 selected from HETT-WW, HECT-RCC1, Gag protein, Gag late domain, Pl3, actin, myosin, Hsp60, Hsp70, Hsp90, STAM1, STAM2A, STAM2B, VHS-UIM, GTPase, E2 enzyme, teg101, cullin, HERC1, HRRC2, HERC3, Nedd4 -like protein or clathrin. The complexes, proteins, antibodies and methods are useful for treating viral infections, such as lymphosarcoma, human

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      polypeptides or nucleic acids for identifying a candidate beta-catenin pathway modulating agent or for modulating a beta-catenin pathway of a cell. The invention also relates to a method of modulating a beta-catenin pathway in a cell; and diagnosing a disease in a patient by detecting MBCAT expression. The invention is based on the finding that MBCAT orthologues are able to modify the beta-catenin pathway in Drosophila cells. Beta-catenin (also known as Armadillo in Drosophila) plays a role in cell signalling via the Wingless (Wg)/Wht signalling pathway which is involved in cell cycle progression. Beta-catenin levels are tightly regulated by a complex containing the tumour suppressor proteins APC (adenomatous polyposis coli) and Axin and the serine/threonine kinase GSK3-beta. In the absence of these proteins, beta-catenin accumulates in
immunodeficiency virus (HIV), hepatitis, poliomyelitis, measles, or Ebola and for inhibiting budding in a subject. They are also useful in diagnostic assays for determining whether a cell is infected with a virus and for characterising the nature, progression and/or infectivity of the infection. The invention is also useful in protein therapy. The present sequence is human NEDD4 protein used to illustrate the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Identifying a candidate beta-catenin MBCAT pathway modulating agent, useful for diagnosing and treating cancer, comprises providing an assay

the nucleus where it acts as a transcriptional co-activator with TCF for the induction of target genes such as the cell-cycle regulators cyclin D1 and c-Myc. The Wingless/Deta-catenin signalling pathway is frequently mutated in human cancers, particularly those of the colon. Beta-catenin pathway modulating agents identified using the methods of the invention are useful as therapeutic agents for treating disorders associated with defective or impaired beta-catenin function and/or MBCAT function such as cancer, or angiogenic, apoptotic or cell proliferation disorders. Proteins that interact with MBCAT are also useful in detecting and providing information about the function of MBCAT proteins. The present sequence represents a human NED4 (neural precursor cell expressed, developmentally downregulated 4) protein, identified as an MBCAT polypeptide in an example of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Inhibitor; ubiquitin-mediated proteolyais; IkappaB polypeptide; HECT; ubiquitin-conjugating system; Homologous to E6-Ap carboxyl terminus; ligase; ubiquitini; ubiquitination; RSC ligase; KTAAN ligase; UBC4; MAD3; modulator; treatment; proliferative disorder; apoptosis; sepsis; differentiative disorder; viral infection; tissue wasting disorder; cachexia; malignancy; inflammatory disease; parasitic disease; tuberculosis; IL-2 therapy; rheumatoid strintiis; rheumatoid spondylitis; osteoarthritis; gouty arthritis; respiratory distress syndrome; cerebral malaria; chronic pulmonary inflammatory disease; silicosis; pulmonary sarcoidosis; bone resorption disease; reperfusion injury; graft versus host reaction; allograft rejection; Crohn's disease; systemic lupus erythematosus; leprosy; AIDS.

comprises: (a) providing a ubiquitin-conjugating system infulbible of Ubiquitin-mediated proteolysis of a IkappaB polypeptide. The method comprises: (a) providing a ubiquitin-conjugating system including the IkappaB polypeptide and a HECT (Homologous to E6-Ap Carboxy) Terminus) comprises: (a) providing a ubiquitin-conjugating system including the ligase and ubiquitin, to promote ubiquitination of the IkappaB polypeptide by the HECT ligase; (b) contacting the ubiquitination of system with a candidate agent; (c) measuring a level of ubiquitination of the IkappaB polypeptide in the presence of the candidate agent in the presence of the candidate agent in the presence of the candidate agent is indicative of the IkappaB polypeptide in the absence of the candidate agent is indicative of an inhibitor of ubiquitination of the IkappaB polypeptide in the presence of the candidate agent is indicative of an inhibitor of ubiquitination of the IkappaB polypeptide in the presence of the candidate agent is indicative of an inhibitor of ubiquitination of the IkappaB polypeptide of an inhibitor of ubiquitination of the IkappaB polypeptide of an inhibitor of ubiquitination of the IkappaB polypeptide of an inhibitor of ubiquitination of the candidate agent is indicative of an inhibitor of ubiquitination of the modulate spot of upidate agent is indicative of an inhibitor of upidate agent of a sasays can be used to identify compounds which modulators can be used e.g. in the treatment of proliferative and/or differentiative disorders, to modulate apoptosis, in the treatment of viral subtractors, and in the treatment of treatment of wiral whose interapy, rheumatory diseases, parasitic diseases, tuberculosis and high dose IL-2 therapy; rheumatory diseases, parasitic diseases, tuberculosis and chid mamatory diseases, silicosis, pulmonary sarchidosis, dronic pulmonary confittaneous, confitton, allografic or anumber of autoimmune diseases such as multiple solerosis, autoimmune diseases such as multiple solerosis, in the invention confit i
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

The present sequence is the WW domain of a HECT (homologous to B6 carboxyl terminus) E3 ubiquitin ligase. The WW domain binds to the Smad PY the Saulting in ubiquitin ligase. The WW domain binds to the Smad PY the Saulting in ubiquitination of Smad by the E3 ubiquitin ligase. The sequence is provided in a specification relating to a method for screening for agents that modulate transforming growth factor (TGF)-beta and/or bone morphogenic protein (BMP)-mediated signalling. The method involves evaluating the effect of an agent on binding of HECT E3 ubiquitin ligase, or on the cellular levels of Smad protein HECT E3 ubiquitin ligase, or on the cellular levels of Smad protein the formation in a patient or treating a condition associated with insufficient TGF-beta and/or BMP-mediated cell signalling. Agents that inhibit BMP-mediated signalling are useful for treating inflammation, ageing cancer and infectious diseases. Agents that augment BMP-mediated signalling are useful for stimulating bone anabolism as well as treating that that inhibit TGF-mediated signalling are useful for treating cancer, inflammation, neurodegeneration and fibrosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ò
                                                                                                                           Screening for modulators of TGF-beta and/or bone morphogenic protein (BMP) mediated signaling useful for treating cancer and osteoporosis by evaluating the ability of agents to modulate Smad protein degradation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WW domain; drug candidate screening; drug discovery; drug modification; drug refinement; immunogen; WW binding protein; mouse; ned4; WW domain.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (FOWL/)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RESULT 7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ADB49212
```

```
The invention describes a purified polypeptide (I) comprising a WW domain which has a sequence (S1) selected from 11 sequences fully defined in the specification, a sequence (S2) selected from 48 sequences fully defined in the specification or a sequence (S3) comprising 681, 906, 224 or 725 amino acids fully defined in the specification. (I) is useful for screening a potential drug candidate, by allowing (I) to come into contact with at least one recognition unit having a selective affinity for the WW domain in (I), in the presence of an amount of a potential drug candidate, such that (I) and the recognition unit are capable of the drug candidate, and determining the effect, if any, of the presence of the amount of the drug candidate on the interaction of (I) with the certification and refinement, for discovering polypeptides involved in pharmacological activities, or as an immunogen to generate antibodies. This is the amino condidates activities, or as an immunogen to generate antibodies. This is the amino condidates and demain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WW domains (AAR97673-92) were identified in a number of proteins involved in signalling or regulatory functions. The WW domain was initially
for discovering polypeptides or as an immunogen to generate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DNA encoding Yes proto-oncogene associated protein - used to modulate intracellular signal transduction e.g. for treatment of muscular

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a method for mediating protein-protein interaction, which comprises modulating the binding of a Ww-domain containing peptide with a phosphorylated ligand e.g. tau. Ww-domain highly conserved regions of approximately 40 amino acid residues with two invariant tryptophans (W) in a triple stranded beta-sheet. The present sequence is one such Ww-domain. When a Ww-domain containing peptide is phosphorylated at serine or threonine residues, dephosphorylation of ligands bound to the peptide is inhibited. The present peptide may be useful for mediating protein-protein interaction, regulating cell growth, resqulating protein degradation, restoring the function of tau to bind microtubules and promote or restore microtubule assembly in neurodegenerative diseases e.g. Alzheimer's Dementia puglistica, Down's syndrome, Parkinson's disease, multiple sclerosis, muscular dystrophy, Corticobasal degeneration, Frontotemporal dementias,
identified in the Yes proto-oncogene associated proteins (YAPs) of consensus chicken, human and mouse (see also AAR97669-70 and AAR9762). A consensus sequence is given in AAR97671. Mouse Nedd4 plays a role in embryonic development and CNS differentiation. The Nedd4 WW domains (AAR97680-82) can be expressed in bacterial, yeast, insect or mammalian cells, and used to identify WW domain ligands. They can be introduced into cells, either directly or by gene therapy, to increase the level of signal transduction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WW-domain; protein-protein interaction; cell growth regulation; protein degradation regulation; Alzheimer's; Dementia pugilistica; Down's syndrome; Parkinson's disease; Pick's; neurodegenerative; microtubule assembly; tau; hyperplasia; neoplasia; malignancy; psoriasis; retinosis; atherosclerosis; leukaemia; lymphoma; papiloma; pulmonary, fibrosis; rhematoid arthritis; multiple sclerosis;

Myotonic dystrophy, Niemann-Pick disease, prion disease with tangles, progressive supranuclear palsy and subacute sclerosing panencephalistis. In addition, inhibitors or stimmlators of interactions between WW-domains and ligands of the present invention can be used to treat hyperplastic and neoplastic disorders e.g. all forms of malignancies, psoriasis, retinosis, atherosclerosis resulting from plaque formation, leukaemias, benign tumour growth, lymphomas, papilomas, pulmonary fibrosis and rhematoid arthritis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention describes a purified polypeptide (I) comprising a WW domain which has a sequence (S1) selected from 11 sequences fully defined in the specification, a sequence (S2) selected from 48 sequences fully defined in the specification or a sequence (S3) comprising 683, 906, 224 or 725 amino acids fully defined in the specification. (I) is useful for screening a potential drug candidate, by allowing (I) to come into contact with at least one recognition unit having a selective affinity for the WW domain in (I), in the presence of an amount of a potential drug candidate, such that (I) and the recognition unit are capable of interacting when brought into contact with one another in the absence of the drug candidate, and determining the effect, if any, of the presence of the amount of the drug candidate on the interaction of (I) with the recognition unit. (I) is useful for drug discovery, modification and refinement, for discovering polypeptides involved in pharmacological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WW domain; drug candidate screening; drug discovery; drug modification; drug refinement; immunogen; WW binding protein; human; ned4; WW domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel purified polypeptide comprising WW domain, useful for drug discovery, modification and refinement, for discovering polypeptides involved in pharmacological activities, or as an immunogen to generate

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human protein ubiquitin ligases publ (AAW13384), pub2 (AAW13385) and pub3 (AAW13386) are homologues of fission yeast publ (AAW13387) and were identified from cDNA clones (AAT47040-42) obtd. e.g. from a keratinocyte CDNA library. Pub polypeptides can be produced in transfected host cells. They can control the steady state level of cdc25 phosphatese, the degree of CDK kinase (e.g. cdc2) dephosphorylation and the steady state level of p53 (controlling the degree of cell cycle regulation of p53). They can regulate cell or tissue differentiation, or cell growth or proliferation by affecting other proteins, can be a specific (ant)agonist of wild type protein function and may be used as immunogens to elicit a specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             and Saccharomyces pombe protein ubiquitin ligase(s) - involved in phosphatase and p53 ubiquitination, and regulate cell growth and

                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                               New isolated cancer associated nucleic acids comprising at least 10 contiguous nucleotides, useful for diagnosing, preventing and/or treating
                                                                                                                                                                                                                                                                                                                    The present invention relates to cancer associated sequences (ADQ97025-ADQ98004). The sequences are useful for the diagnosis, prevention and/or treatment of cancer, such as leukemia and lymphoma. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic formate directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Kidney disease; nephrotropic; renal disease; IgA nephropathy; IgAN, asymptomatic microscopic haematuria; proteinuria; episodic gross haematuria; necrtishing crescentic glomerulonephritis; MCGN; minimal change disease; Min Ch; renal hypertrophy; diabetes; end-stage renal disease; ESRD; kidney function.
                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

compound libraries to discover movel therapeutics to regulate kidney function; as an antigen to raise polyclonal or monoclonal antibodies, and sa a therapeutic agent to rarget. Agents that modulate, up-or-down-regulate the expression of [11] or agents that agonise or antagonise the activity of the protein are useful to modulate biological and pathologic damage or end-stated with proteins function and activity, for e.g. kidney damage or end-stage renal disease (BSRD). This is the amino acid sequence of the diseased kidney associated novel human protein #2, described in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention describes an isolated nucleic acid molecule (I) that is expressed in diseased kidney tissue compared to normal kidney tissue. (I) and its encoded protein (II) are useful for diagnosing a renal disease state e.g. IgA nephropathy (IgAN) which presents as asymptomatic microscopic haematuria and/or proteinuria or episodic gross haematuria, merotosinging crescnitic glomerulonephritis (NCGN), minimal changed disease (Min Ch) or renal hypertrophy (the cause of end stage renal disease and early manifestation of diabetes), in a subject. (II) is useful: as a rarget for identifying agents which modulate the expression or activity of (I), for identifying binding partners, as novel target for screening synthetic small molecules and combinatorial or naturally occurring
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  cytostatic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is the protein sequence of human CGDD-3, a novel protein associated with cell growth, differentiation and death. The sequence is predicted from Incyte clone 366046cBL, which was isolated from a brain tumour tissue cell line CDNA library. Structural features catablish the protein as being associated with cell growth, differentiation and death, with further evidence suggesting it to be a differentiation protein ligase. The invention is based on novel human CGDD-1 to 21 proteins (see ABPS8330-50), the polynucleotides encoding them (see ABPS4689-709), and to the use of these for the diagnosis, treatment or prevention of cell proliferative disorders including cancer, cavelopmental disorders, neurological disorders, autoimmune disorders, reproductive disorders, and disorders of the placenta, and in the assessment of the effects of exogenous compounds on the activity and catherentiation and death
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ç

The invention relates to newly discovered cancer markers associated with the cancerous state of prostate cells. Also disclosed is a method of assessing whether a patient is afflicted with prostate cancer. The method of the invention involves assessing whether a patient is afflicted with prostate cancer. The method of the invention involves assessing whether a patient is afflicted with prostate cancer by comparing the level of expression of the marker in a control non-prostate cancer sample, where a significant increase in the level of expression of the marker in the patient sample and the normal cancer.

Nucleic acids of the invention are useful for diagnosing or treating prostate cancer, and may be useful in gene therapy. Sequences given in ABB5177-ABB7531 represent marker cDNA and proteins. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at Etp.wipo.int/pub/published_pct_sequences.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A Description: involved in of the mitotic activating tyrosine phosphatase cdc25 [validat C, Function: arDL.

C, Function: arDL.

C, Function: arDL.

C, Superfamily: yeast ubiquitin-protein ligase; WW repeat homology

C, Keywords: cell cycle control; ligase

C, Keywords: cell cycle control; ligase

F, 206-242/Domain: WW repeat homology armus

F, 288-325/Domain: WW repeat homology armus

F, 382/Domain: WW repeat homology armus

F, 382/Domain: WW repeat homology armus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A;Map position: 3

```
The present sequence is the WW domain of a HECT (homologous to E6 carboxyl terminus) E3 ubiquitin ligase. The WW domain binds to the Smad PY motif, resulting in ubiquitination of Smad by the E3 ubiquitin ligase. The sequence is provided in a specification relating to a method for screening for agents that modulate transforming growth factor (TGF)-beta and/or bone morphogenic protein (BMP)-mediated signalling. The method involves evaluating the effect of an agent on binding of HECT E3 ubiquitin ligase WW domain to Smad PY motif, on ubiquitination of Smad protein by E3 ubiquitin ligase, or on the cellular levels of Smad protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Screening for modulators of TGF-beta and/or bone morphogenic protein (BMP) mediated signaling useful for treating cancer and osteoporosis by evaluating the ability of agents to modulate Smad protein degradation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; HECT; homologous to E6 carboxyl terminus; ubiquitination; HECT E3 ubiquitin ligase; antiinflammatory; cytostatic; osteopathic; antimicrobial; neuroprotective; transforming growth factor beta; TGF-beta; bone morphogenic protein; BMP; Smad; cell signalling; inflammation; ageing; cancer; infection; bone anabolism; osteoporosis; renal failure; neurodegeneration; fibrosis; WW domain; Nedd4.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is the WW domain of a HECT (homologous to E6 carboxyl terminus) E3 ubiquitinal ligase. The WW domain binds to the Smad by motif, resulting in ubiquitination of Smad by the E3 ubiquitinal ligase. The sequence is provided in a specification relating to a method for screening for agents that modulate transforming growth factor (TGF)-beta and/or bone morphogenic protein (BMP)-mediated signalling. The method involves evaluating the effect of an agent on binding of HECT E3 ubiquitin ligase WM domain to Smad by motif, on ubiquitination of Smad protein by E3 ubiquitin ligase, or on the cellular levels of Smad protein HECT E3 ubiquitin ligase activity. The method is useful for stimulating bone formation in a patient or treating a condition associated with insufficient TGF-beta and/or BMP-mediated cell signalling. Agents that inhibit BMP-mediated signalling are useful for treating inflammation,
                                 bone formation in a patient or treating a condition associated with insufficient TGF-beta and/or BMP-mediated cell signalling. Agents that inhibit BMP-mediated cell signalling. Agents that ageing, cancer and infectious diseases. Agents that augment BMP-mediated signalling are useful for treating bone anabolism as well as treating broken bones, osteoporosis, and acute or chronic renal failure. Agents that inhibit TGF-mediated signalling are useful for treating cancer, inflammation, neurodegeneration and fibrosis
ubiquitin ligase activity. The method is useful for stimulating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (BMP) mediated signaling useful for treating cancer and osteoporosis by evaluating the ability of agents to modulate Smad protein degradation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; HECT; homologous to E6 carboxyl terminus; ubiquitination; HECT E3 ubiquitin ligase; antiinflammatory; cytostatic; osteopathic; antimicrobial; neuroprotective; transforming growth factor beta; TGF-beta; bone morphogenic protein; BMF; Smad; cell signalling; inflammation; againg; cancer; infection; bone anabolism; osteoporosis; renal failure; neurodegeneration; fibrosis; WW domain; Nedd4.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method for modulation of viral maturation. The invention also provides an isolated protein complex comprising a HECT-RCI selected from HETT-WW, HECT-RCI, Gag protein, Gag late domain, P13, actin, myosin, Hsp60, Hsp70, Hsp90, STAM1, STAM2A, STAM2A, WHS-UIM, GTPase, E2 enzyme, tsg101, cullin, HERCI, HERCI, HERCI, Med4 -like protein or clathrin. The complexes, proteins, antibodies and methods are useful for treating viral infections, such as lymphosarcoma, human immunodeficiency virus (HIV), hepatitis, poliomyelitis, measles, or Ebola and for inhibiting budding in a subject. They are also useful in diagnostic assays for determining whether a cell is infected with a virus and for characterising the nature, progression and/or infectivity of the
ageing, cancer and infectious diseases. Agents that augment BMP-mediated signalling are useful for stimulating bone anabolism as well as treating broken bones, osteoporosis, and acute or chronic renal failure. Agents that inhibit TGF-mediated signalling are useful for treating cancer, inflammation, neurodegeneration and fibrosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Viral infection; lymphosarcoma; human immunodeficiency virus; hepatitis; poliomyelitis; HIV; measles; protein therapy; human; NEDD4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New protein complex comprising HECT-RCC1, viral maturation scaffolding protein (VMSP), and/or HIV gag protein, useful for treating viral infections, such lymphosarcoma, HIV, hepatitis, poliomyelitis, measles,
                                                                                                                                                                                Gaps

                                                                                                                                                                                                             ð
                                                                                                                                                                                                                                    원
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                polypeptides or nucleic acide for identifying a candidate beta-catenin pathway modulating agent or for modulating a beta-catenin pathway of a cell. The invention also relates to a method of modulating a beta-catenin pathway of a pathway in a cell; and diagnosing a disease in a patient by detecting manager to modify the beta-catenin pathway in Drosophila crhologues are able to modify the beta-catenin pathway in Drosophila cells. Beta-catenin (also known as Armadillo in Drosophila) plays a role in cell signalling via the Wingless (Wg) /Wit signalling pathway which is involved in cell cycle progression. Beta-catenin levels are tightly capulated by a complex containing the tumour suppressor proteins APC (adenomateous polyposis coll) and Axin and the serine/threonine kinase GSK3-beta. In the absence of these proteins, beta-catenin accumulates in the induction of target genes such as the cell-cycle regulators cyclin D1 cand c-Myc. The Wingless/beta-catenin signalling pathway is frequently mutated in human cancers, particularly those of the colon. Beta-catenin

ö
pathway modulating agents identified using the methods of the invention are useful as therapeutic agents for treating disorders associated with defective or impaired beta-catenin function and/or MBCAT function such as cancer, or anglogenic, apoptotic or cell proliferation disorders. Proteins that interact with MBCAT are also useful in detecting and providing information about the function of MBCAT proteins. The present sequence represents a human NED94 (neural precursor cell expressed, developmentally downregulated 4) protein, identified as an MBCAT polypeptide in an example of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ubiquitin-conjugating system; Homologius to E6-Ap carboxyl terminus; ubiquitin, ubiquitination; RSC ligase; KIAAN ligase; UBC4; MAD3; modulator; treatment; proliferative disorder; apoptosis; sepsis; differentiative disorder; apoptosis; sepsis; differentiative disorder; viral infection; tissue wasting disorder; cachexia; malignancy; inflammarcry disease; parasitic disease; tuberculosis; IL-2 therapy; rheumatory disease; parasitic disease; osteoarthritis; gouty arthritis; respiratory distress syndrome; cerebral malaria; chronic pulmonary inflammatory disease; silicosis; pulmonary sarcoidosis; bone resorption disease; reperfusion injury; graft versus host reaction; allograft rejection; Crohn's disease; ulcerative colitis; pyresis; multiple sclerosis; autoimmune diabetes;

ubiquitin-mediated proteolysis of a IkappaB polypeptide. The method comprises: (a) providing a ubiquitin-conjugating system including the IkappaB polypeptide and a HECT (Homologous to E6-Ap Carboxyl Terminus) ligase and ubiquitin, to promote ubiquitination of the IkappaB polypeptide by the HECT ligase; (b) contacting the ubiquitin-conjugating system with a candidate agent; (c) measuring a level of ubiquitination of the polypeptide in the presence of the candidate agent and (d) comparing the molypeptide in the presence of the candidate agent is indicative of the IkappaB polypeptide in the absence of the candidate agent; where a statistically significant decrease in ubiquitination of the IkappaB polypeptide in the presence of the candidate agent; where a statistically significant decrease in ubiquitination of the IkappaB polypeptide in the presence of the candidate agent is indicative of an inhibitor of ubiquitination of the IkappaB polypeptide in the presence of the modulate binding and/or ubiquitinylation of an IkappaB (or other cellular corral substrate) by a HECT ligase, such as RSC or KIAAN. Such modulate binding and/or ubiquitinylation of an IkappaB (or other cellular or viral substrate) by a HECT ligase, such as RSC or KIAAN. Such modulators can be used e.g. in the treatment of proliferative and/or differentiative disorders, to modulate apoptosis, in the treatment of viral infections, and in the treatment of tissue wasting disorders e.g. cachexia secondary to infection or malignancy, cachexia secondary to infection or malignancy, cachexia secondary to infection are malignancy, cachexia secondary to infection are arthritis and other arthritic conditions, secondary arthritis and other arthritic conditions, resorption diseases, incleases, ulcerative colitis, or pyresis, in addition to a number of autoimmune diseases such as multiple sclerosis, autoimmune to a number of autoimmune diseases such as multiple sclerosis, in the invention and in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Viral infection; lymphosarcoma; human immunodeficiency virus; hepatitis; poliomyelitis; HIV; measles; protein therapy; human; NEDD4.

The invention also provides an isolated protein complex comprising a HECT-
SCCI selected from HETT-WW, HECT-KCL, Gag protein, Gag late domain, Pl3, actin, myosin, HSp60, HSp70, HSp90, STAM1, STAM2A, STAM2B, VHS-UIM,
GTPBSE, E2 enzyme, tSg101, cullin, HBRC1, HERC2, HERC3, Ned44 -like useful for treating viral infections, such as lymphosarcoma, human immunodeficiency virus (HTV), hepatitis, poliomyellitis, measles, or Ebola and for inhibiting budding in a subject. They are also useful in diagnostic assays for determining whether a cell is infected which a virus and for characterising the nature, progression and/or infectivity of the infection. The invention is also useful in protein therapy. The present sequence is human NEDD4 protein used to illustrate the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          WW domain; drug candidate screening; drug discovery; drug modification; drug refinement; immunogen; Ww binding protein; mouse; ned4; Ww domain.

                                                                                                          invention describes a purified polypeptide (1) comprising a WW domain h has a sequence (S1) selected from 11 sequences fully defined in the ification, a sequence (S2) selected from 48 sequences fully defined
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      WW domains (AAR97673-92) were identified in a number of proteins involved in signalling or regulatory functions. The WW domain was initially
                                                                                                                            which has a sequence (S1) selected from 11 sequences fully defined in the specification, a sequence (S2) selected from 48 sequences fully defined in the specification or a sequence (S3) comprising 683, 966, 224 or 725 amino acids fully defined in the specification. (I) is useful for screening a potential drug candidate, by allowing (I) to come into contact with at least one recognition unit having a selective affinity for the WW domain in (I), in the presence of an amount of a potential drug candidate, such that (I) and the recognition unit are capable of interacting when brought into contact with one another in the absence of
                                                                                                                                                                                                                                                                                                                                                                        activities, or as an immunogen to generate antibodies. This is the amino acid sequence of WW binding protein Ned4 WW domain.
                                                                                                                                                                                                                                                                                              the drug candidate, and determining the effect, if any, of the presence of the amount of the drug candidate on the interaction of (1) with the recognition unit. (1) is useful for drug discovery, modification and refinement, for discovering polypeptides involved in pharmacological
 for discovering polypeptides or as an immunogen to generate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DNA encoding Yes proto-oncogene associated protein - used to modulate intracellular signal transduction e.g. for treatment of muscular

ö
identified in the Yes proto-oncogene associated proteins (YAPs) of chicken, human and mouse (see also AAR97669-70 and AAR97672). A consensus sequence is given in AAR97671. Mouse Nedd4 plays a role in embryonic development and CNS differentiation. The Nedd4 www domains (AAR97680-82) can be expressed in bacterial, yeast, insect or mammalian cells, and used to identify WW domain ligands. They can be introduced into cells, either directly or by gene therapy, to increase the level of signal transduction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               WW-domain; protein-protein interaction; cell growth regulation; protein degradation regulation; Alzheimer's; Dementia pugilistica; Down's syndrome; Parkinson's disease; Pick's; neurodegenerative; microtubule assembly; tau; hyperplasia; neoplasia; malignancy; psoriasis; retinosis; atherosclerosis; leukaemia; lymphoma; papiloma; pulmonary fibrosis; rhematoid arthritis; multiple sclerosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Mediating protein-protein interactions, useful for regulating cell growth and for treating neurodegenerative disorders, comprises modulating binding of WW domain containing polypeptide with phosphorylated ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a method for mediating protein-protein interaction, which compristes modulating the binding of a Ww-domain containing peptide with a phosphorylated ligand e.g. tau. WW-domains are highly conserved regions of approximately 40 amino acid residues with two
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Down's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   invariant tryptophans (W) in a triple stranded beta-sheet. The present sequence is one such WW-domain. When a WW-domain containing peptide is phosphorylated at serine or threonine residues, dephosphorylation of ligands bound to the peptide is inhibited. The present peptide may be useful for mediating protein-protein interaction, regulating cell growth, regulating protein degradation, restoring the function of tau to bind microtubules and promote or restore microtubule assembly in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     neurodegenerative diseases e.g. Alzheimer's, Dementia pugilistica, Down'syndrome, Parkinson's disease, Pick's disease, multiple sclerosis, muscular dystrophy, Corticobasal degeneration, Frontotemporal dementias,

Myotonic dystrophy, Niemann-Pick disease, prion disease with tangles, progressive supranuclear palsy and subacute sclerosing panencephalistis. In addition, inhibitors or stimmlators of interactions between Ww-domains and ligands of the present invention can be used to treat hyperplastic and neoplastic disorders e.g. all forms of malignancies, psoriasis, retinosis, atherosclerosis resulting from plaque formation, leukaemias, benign tumour growth, lymphomas, papilomas, pulmonary fibrosis and rhematoid arthritis
                                                                                                                                                                                                                                                                                                                                                                                                                 WW domain; drug candidate screening; drug discovery; drug modification; drug refinement; immunogen; WW binding protein; human; ned4; WW domain.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WW domains (AAR97673-92) were identified in a number of proteins involved in signalling or regulatory functions. The WW domain was initially identified in the Yes proto-oncogene associated proteins (YAPs) of chicken, human and mouse (see also AAR97669-70 and AAR97672). A consensus sequence is given in AAR97671. Mouse Need4 plays a role in embryonic development and CNS differentiation. The Nedd4 WW domains (AAR97680-82).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           can be expressed in bacterial, yeast, insect or mammalian cells, and used to identify WW domain ligands. They can be introduced into cells, either directly or by gene therapy, to increase the level of signal transduction
activities, or as an immunogen to generate antibodies. This is the amino acid sequence of WW binding protein Ned4\ WW\ domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DNA encoding Yes proto-oncogene associated protein - used to modulate intracellular signal transduction e.g. for treatment of muscular

RESULT 12

The invention describes a purified polypeptide (I) comprising a WW domain which has a sequence (S1) selected from 11 sequences fully defined in the specification, a sequence (S2) selected from 49 sequences fully defined in the specification or a sequence (S3) comprising 683, 906, 224 or 725 amino acids fully defined in the specification. (I) is useful for screening a potential drug candidate, by allowing (1) to come into contact with at least one recognition unit having a selective affinity for the WW domain in (I), in the presence of an amount of a potential drug candidate, such that (I) and the recognition unit are capable of interacting when brought into contact with one another in the absence of the drug candidate, and determining the effect, if any, of the presence of the amount of the candidate on the interaction of (I) with the recognition unit. (I) is useful for drug discovery, modification and refinement, for discovering polypeptides involved in pharmacological

The invention describes a purified polypeptide (I) comprising a Ww domain which has a sequence (S1) selected from 11 sequences fully defined in the specification, a sequence (S3) selected from 48 sequences fully defined in the specification or a sequence (S3) comprising 683, 906, 224 or 725 amino acids fully defined in the specification. (I) is useful for screening a potential drug candidate, by allowing (I) to come into contact with at least one recognition unit having a selective affinity for the WW domain in (I), in the presence of an amount of a potential drug candidate, such that (I) and the recognition unit are capable of interacting when brought into contact with one another in the absence of the amount of the drug candidate, and determining the effect, if any of the presence of the amount of the drug candidate on the interaction of (I) with the recognition unit. (I) is useful for drug discovery, modification and refinement, for discovering polypeptides involved in pharmacological activities, or as an immunogen to generate antibodies. This is the amino acid sequence of WW binding protein Ned4 WW domain.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention describes a purified polypeptide (I) comprising a WW domain which has a sequence (SI) selected from 11 sequences fully defined in the specification, a sequence (S2) selected from 48 sequences fully defined in the specification or a sequence (S3) comprising 683, 906, 224 or 725 amino acids fully defined in the specification. (I) is useful for screening a potential drug candidate, by allowing (I) to come into contact with at least one recognition unit having a selective affinity for the WW domain in (I), in the presence of an amount of a potential drug candidate, such that (I) and the recognition unit are capable of the drug candidate, and determining the effect, if any, of the presence of the amount of the drug candidate on the interaction of (I) with the recognition unit. (I) is useful for drug discovery, modification and refinites, or as an immunogen to generate antibodies. This is the amino acid sequence of WW binding protein Ned4 WW domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ..

                                                                                                                                                                                                                                                                                      Human protein ubiquitin ligases publ (AAW13384), pub2 (AAW13385) and pub3 (AAW13386) are homologues of fission yeast publ (AAW13387) and were identified from cDNA clones (AAT47040-42) obtd. e.g. from a keratinocyte CDNA library. Pub polypeptides can be proded in transfected host cells. They can control the steady state level of cdc25 phosphatase, the degree of CDK kinase (e.g. cdc2) dephosphorylation and the steady state level of p53 (controlling the degree of cell cycle regulation of p53). They can regulate cell or tissue differentiation, or cell growth or proliferation by affecting other proteins, can be a specific (ant)agonist of wild type protein function and may be used as immunogens to elicit a specific

New isolated cancer associated nucleic acids comprising at least 10 contiguous nucleotides, useful for diagnosing, preventing and/or treating
                                                                                                                                                                                                                        The present invention relates to cancer associated sequences (ADQ97025-ADQ98004). The sequences are useful for the diagnosis, prevention and/or treatment of cancer, such as leukemia and lymphona. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic formate directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Patent No. 6011137

GENERAL INFORMATION:
Patent No. 6011137

GENERAL INFORMATION:
Prozzi, Gregorio
APPLICANT: Pizozzi, Gregorio
APPLICANT: Prozzi, Gregorio
APPLICANT: Powlkes, Dana M.
TITLE OF INVENTION: DENTIFICATION AND ISOLATION OF NOVEL
TITLE OF INVENTION: POLYPEPTIDES HAVING WW DOMAINS AND METHODS OF USING SAME
NUMBER OF SEQUENCES: 124

CORRESPONDENCE ADDRESS:
ADDRESSEE: Pennie & Edmonds
STREET: 1155 Avenue of the Americas
CITY: New York

STREET: New York
